

Appl. No.: 09/808,553
Amdt. dated September 10, 2004
Reply to Office action of June 10, 2004

Amendments to the Specification

Please replace the paragraph starting at page 1, line 10 and ending at page 2, line 2 with the following:

The World Wide Web (WWW or Web) is fast becoming not only the Internet's multimedia information retrieval system, but also the Internet's personal and group information storage and retrieval system. In the Web environment, client machines effect transactions with Web applications through Web servers using HyperText Transfer Protocol (HTTP), which is a standard application protocol facilitating the storage of and access to files (e.g. document, images, music, sound, video, etc), using a standard document description language known as HyperText Markup Language (HTML). HTML provides the rules for basic document description and formatting, and allows a document developer to design and provide forms to, among other things, indicate and attach files for uploading to Web applications, specify links for retrieving files from Web applications, and specify links to other Web applications. A Web site is a computer system that makes a collection of files available through a Web server. A Web application is a Web site that is interactive and provides an application as a service to users through a Web server. A typical example of a Web application is one that uploads, downloads and shares files and other forms of digital media. On the Internet, a Uniform Resource Locator (URL) identifies the network path to any Web resource. A URL is therefore a special syntax for defining an Internet connection. With a HTML-compatible Web browser, such as Netscape Communications Corporation's ~~Netscape Communicator~~ NETSCAPE COMMUNICATOR® or Microsoft Corporation's ~~Internet Explorer~~ INTERNET EXPLORER®, a client machine may specify a connection with a Web application via a URL. The client machine, in effect, makes a request to the Web site or application identified in the URL. In return, the client machine receives a response such as a document or other objects formatted according to HTML.

Please change the title to:

"A System and Method for Redirection of User-specific Data Storage Requests"
